# Expanding the Value, Impact, and Reach of the California Student Wellness Index

We recently developed and validated the 10-item California Student Wellness Index (CSWI) for the California Healthy Kids Survey (CHKS). <sup>1</sup> This index provides schools with anonymous and comprehensive insights into their students' mental wellbeing. By using the CSWI in conjunction with other validated items from the CHKS, schools are enriching their understanding of the connections between students' mental health and behavioral health risk factors.

The California Student Wellness Index (CSWI), initially validated with a sample of 626,000 students in grades 6-12, offers a reliable method for assessing mental wellness. However, its effectiveness as a standalone screening tool is limited because school care teams often struggle to identify which students need follow-up interviews. While some schools currently use the CSWI as part of universal wellness screenings on online survey platforms, broader and more impactful adoption will necessitate further enhancements.

It is crucial to incorporate additional asset-focused components and conduct non-anonymous screenings to enhance the effectiveness of the CSWI. These improvements will help us better understand students' perspectives and beliefs, highlight their strengths, and gather valuable insights. By

including questions about school relationships and climate, we can examine the nurturing environment within the school and, ultimately, increase the contributions of the CSWI.

Other CHKS components offer valuable insights into students' social and psychological well-being, which enhance and complement the CSWI. Building on our previous efforts, supported by a measurement grant from the Institute of Education Sciences, we have successfully validated two additional CHKS measures in close collaboration with the California Department of Education and WestEd.

The CSWI, the Social-Emotional Health Survey-Secondary (SEHS-S), and School Connectedness (Connectedness) are core components of the California Healthy Kids Survey (CHKS). Despite their essential roles in the CHKS, there is currently no information available regarding their associations or normative distributions. This lack of normative data for both the SEHS-S and Connectedness represents a missed opportunity for schools aiming to improve student well-being. By developing a comprehensive report that combines student responses from the CSWI with connectedness and strengths scores, we can provide educators with valuable insights into their students' experiences. This vital information can help schools create nurturing environments that prioritize social-emotional well-being and foster stronger connections among students.

The CSWI, SEHS-S, and Connectedness self-report measures make up the CARES: Comprehensive Assessment of Resilience and Emotional Strength. These three assessments provide valuable insights into students' psychological well-being and their perceptions of relationships within the school environment. The concise format of these assessments allows for widespread and flexible administration, enabling educators to understand individual student needs and foster stronger social bonds and connections. Ultimately, this approach can enhance the overall educational experience. In just 27 items, CARES offers insights into students' mental health, their sense of belonging within the school community, and personal strengths that contribute to their resilience and coping abilities, as illustrated in Figure 1.

Figure 1. CARES Component Measures

## **Document's Objectives**

This document evaluates three CHKS measures—CSWI, SEHS-S, and Connectedness—to assess student wellness. A primary objective is to provide schools and mental health staff with co-normative information about these measures based on a substantial sample of secondary students.

The proposed CARES tool is a streamlined screening and monitoring instrument comprising only 27 items. It takes a positive and strengths-focused approach, making it suitable for universal screening and monitoring in educational settings. For example, this tool could be easily integrated as an anonymous module within the CHKS.

By combining three well-designed and rigorously validated measures, CARES creates a consistent method for assessing and understanding students' social and emotional wellbeing. The information provided by CARES offers California-validated normative data to support educators in making data-informed decisions regarding the selection, implementation, and evaluation of student wellness services.

### **CARES Measures**

## California Student Wellness Index

The CSWI is a concise self-report tool consisting of ten items designed to assess overall mental wellbeing through two main dimensions: life satisfaction and emotional distress. Life satisfaction is measured using the Multidimensional Student Life Satisfaction Scale (BMSLSS). This tool is grounded in the Dual-Factor Mental Health model, which combines life satisfaction and emotional distress responses to produce a single composite score ranging from 0 to 40. The CSWI items are listed in Table 1, and Figure 2 displays the distribution of CSWI responses. Table 5 provides the raw-to-standard score conversions.

## **CSWI** Development

The CSWI development involved analyzing data from 626,940 secondary students in California who completed the CHKS during the 2021/22 and 2022/23 academic years. To further assess the validity of the CSWI, we conducted additional analyses using data from independent samples to evaluate its concurrent validity with the SEHS-S, which included responses from 78,769 students collected during the 2020/21 academic year. Furthermore, we examined the stability and predictive validity of the CSWI using the Mental Health Continuum-Short Form (MHC-SF), which involved 1,828 participants from the 2020/21 and 2021/22 academic years. To establish the validity and reliability of the CSWI, we employed confirmatory factor analysis (CFA) and measurement invariance.

### **CSWI** Psychometric Properties

The concurrent validity of the CSWI with the SEHS-S was assessed through confirmatory factor analysis (CFA) and measurement invariance tests. The results showed that the CSWI significantly correlated with

the SEHS-S scores across all four domains, suggesting a moderate correlation with other relevant aspects of students' positive social-emotional health. For a comprehensive description of the psychometric and validity analyses, refer to <u>Furlong et al.</u> (2024).

# Social Emotional Health Survey-Secondary (SEHS-S) <sup>4</sup>

The SEHS-S is a robust and well-validated tool commonly used in research and clinical settings. However, its 36 items make inefficient for universal screening and monitoring purposes. To address this issue, we conducted analyses to develop a more concise version of the assessment and improve its application for wellness screening.

# Social Emotional Health Survey-Brief (SEHS-B) 5

## SEHS-B Development

Research groups from UCSB and <u>Proyecto Covitalidad</u> recognized the need for a shorter version of the SEHS-S. They conducted analyses to develop a concise form. The proposed short version incorporates the best single item from each of the 12 SEHS-S subscales, resulting in scores across four domains: Belief in Self, Belief in Others, Social-Emotional Competence, and Engaged Living, as well as a total social-emotional strengths score.

## SEHS-B Analysis

This analysis included the responses of secondary school students from Spain (51% females) and the USA (50% females). We used item and Rasch analyses on the Spanish sample to select the most representative items for each first-order domain, resulting in a 12-item scale. We then conducted Confirmatory Factor Analyses (CFAs) on these items and explored measurement invariance (MI) across countries, genders, and grades. We correlated the SEHS-S-SF and SEHS-S factors to test convergent validity. We assessed internal consistencies using Cronbach's  $\alpha$  and McDonald's  $\omega$ .

#### **SEHS-B Results**

Our analyses developed and validated a shorter version of the SEHS-S, referred to as SEHS-B (see Table 3). Figure 3 illustrates the SEHS-B total score (range 0-36) response distribution. The higher-order model for the SEHS-B was validated through confirmatory factor analyses. Measurement invariance was established across different countries and educational grades for first- and second-order factor loadings, items, and first-order factor intercepts. However, measurement invariance was only demonstrated for first- and second-order factor loadings when considering sex. The domains of SEHS-B displayed strong correlations with their corresponding SEHS-S domains, with values of .92 or higher. The internal

"Desarrollo y validación transcultural de la Social Emotional Health Survey-Secondary Short Form (SEHS-S-SF). XIII Jornadas de la Asociación Iberoamericana para la Investigación de las Diferencias Individuales "Líneas actuales en el estudio de las diferencias individuales y la salud" celebradas en el Centro de Congresos de Elche (Alicante) los días 26 y 27 de Septiembre de 2024.

consistency indices for the four latent traits ranged from .54 to .81, with the general social-emotional strengths factor achieving a value of .86.

## SEHS-B Summary

Our analyses developed and validated the 12 SEHS-B items (see Table 3). Table 4 provides the raw scores for standard conversions. Table 2 shows the raw score to standard score equivalent values. The SEHS-B demonstrates strong psychometric properties, enabling a comprehensive assessment of higher-order, covitality social-emotional strengths. This short form is convenient for time-limited assessments, such as school wellness screenings. This form can also be administered 2-3 times a year using carefully selected random samples to assess trends in population wellness.

## School Connectedness Scale 8

The Connectedness measure includes five items designed to evaluate students' social relationships within the school environment. Table 4 presents the Connectedness items, and Figure 4 illustrates the distribution of responses. In Table 5, you will find the raw scores used for standard conversions. In contrast, Table 5 is intended to record the Standard Score Equivalent Response Profile.

| Table 4. School Connectedness (Connectedness) Scale Items <sup>9</sup> |    |   |   |   |    |
|------------------------------------------------------------------------|----|---|---|---|----|
| I feel close to people at this school.                                 | SD | D | Ν | А | SA |
| I am happy to be at this school.                                       | SD | D | Ν | Α | SA |
| I feel like I am part of this school.                                  | SD | D | Ν | Α | SA |
| The teachers at this school treat students fairly.                     | SD | D | Ν | Α | SA |
| I feel safe in my school.                                              | SD | D | Ν | А | SA |

<sup>0 =</sup> SD = Strongly disagree.

<sup>1 =</sup> D = Disagree

<sup>2 =</sup> N = Neither disagree nor agree.

<sup>3 =</sup> A = Agree.

<sup>4 =</sup> SD = Strongly agree

## School Connectedness Psychometric Properties

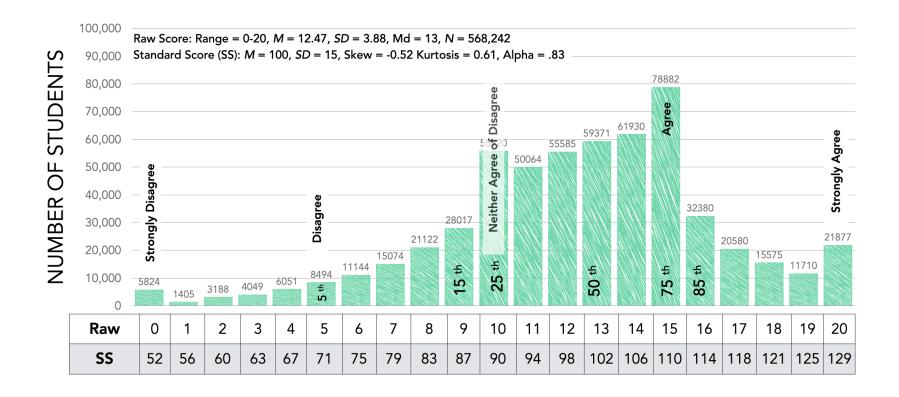

The psychometric properties of the CHKS Connectedness <sup>10</sup> were analyzed for 18 sociocultural groups based on the responses of 500,800 California junior and senior high school students. In a previous study, we found that the fundamental properties of Connectedness are favorable, including its reliability, concurrent validity, and construct structure. In the multigroup invariance testing, a single-factor model of Connectedness was consistent across all 18 sociocultural groups. Confirmatory factor analysis indicated that all items on the Connectedness are related to a single distinct factor. Additionally, the scores on this scale demonstrated internal consistency, making it suitable for both research in schools and practical assessment applications. These results suggest that it is appropriate to compare the effects of Connectedness across different racial and ethnic groups.

## **CARES Information**

# **CARES Applications**

## Universal Screening and Progress Monitoring

The CARES assessment is a practical universal screening tool designed to evaluate students' overall mental wellness. If employed in this way and to maximize its effectiveness, the school wellness care team should actively involve parents or guardians by informing them about the assessment and obtaining their permission for its distribution. Once students consent, they enter an ID, allowing the school care team to follow up and connect them with any necessary support services. The CARES assessment consists of 27 items and can be administered several times each year to monitor students' progress in receiving school counseling and related services.

# **CARES Descriptive Information**

The cross-measures correlations were all positive and in the expected direction: CSWI-Connectedness (r = .50), CSWI-SEHS-B (r = .59), and Connectedness-SEHS-B (r = .45).

## **CARES Normative Information**

Tables 5-9 show the raw score, standard deviations, and selected percentile rank equivales for the Social Emotional Distress Scale, the Student Life Satisfaction Scale, the California Wellness Index, the Social Emotional Health Survey-B, and the School Connectedness Scale.

# **Appendix 1. Source of CARES Student Responses**

## California Healthy Kids Survey (CHKS)

The original CSWI data were collected through the CHKS, an anonymous self-report survey conducted by the California Department of Education (CDE) in partnership with WestEd. The information gathered from the CHKS is used to inform public policy in education and human services, help school districts prioritize planning, and enhance students' school experiences. The CHKS includes questions about resiliency, protective factors, risk behaviors, and school climate.

The CHKS core module includes ten items related to CSWI and the five-item Connectedness scale. The optional Social Emotional Health Module (SEHM) contains the SEHS-S items. Our analysis of student responses to the CHKS during the 2023-2024 academic year provides the CSWI, SEHS-S, and Connectedness data to establish their response distributions. In recent years, driven by the goal of better understanding and promoting students' mental health, many schools have opted to administer the core module annually to students in Grades 6 through 12.

### **CHKS Data Collection Procedures**

School districts obtained guardian consent for students in Grades 7, 9, and 11 to participate in the survey. Some districts also invited students from other Grades (6-12). The procedures for obtaining guardian consent, whether passive or active, vary according to each school district's policy. Student consent was also required.

At the beginning of the survey, participants were informed that their involvement was voluntary. They could skip any questions and discontinue their participation at any time. The administration procedures adhered to all relevant laws and regulations. During the 2023-24 academic year, students completed the online survey in three waves: fall (October–December 2023: 34.0%), winter (January–March 2024: 46.5%), and spring (April–June 2024: 19.5%).

# **CARES Sample**

For the 2023/24 academic year, the high school version consists of 142 items, while the middle school version contains 135 items tailored for younger students. Both versions feature the CSWI and Connectedness items. Students in 512 of the state's 977 school districts, representing 52 of California's 58 counties, participated in the CHKS. Only students who completed all CSWI and Connectedness items and passed the quality checks were included in the analysis for this report. An overview of the 525,520 students in the primary sample is provided in Table 6.

The optional CHKS SEHM was completed by a subsample of 80,947 students from 96 school districts across 28 counties statewide. The gender distribution of this subsample is as follows: male (49.3%), female (48.1%), non-binary (1.2%), and other (1.4%). This distribution closely mirrors the larger sample (see Table 1).

Note. This Table includes students who answered all the CSWI and SEHS-SF items and passed a response quality check. There are more students in Grades 7, 9, and 11 because, historically, the CHKS has been administered to those grades. The students' responses in Grades 6, 8, 10, and 12 are from schools that invited all students to take the survey.

# **Appendix 2. CARES Resources**

When used in the anonymous Healthy Kids Survey, the CSWI offers a reliable mental wellness index, providing overall data that informs mental health policies and practices at the school, district, and state levels. It is essential to note that schools often lack the resources to utilize students' CSWI responses to identify individuals for follow-up interviews or personal evaluations for wellness-promoting services.

In collaboration with WestEd, the State Department of Education has championed the development of a robust infrastructure for managing, scoring, and sharing anonymous CSWI assessments at the school level. However, the lack of resources poses a significant challenge for schools wishing to implement the CSWI in a non-anonymous manner, such as through student ID entry, as part of a comprehensive, school-wide wellness screening and monitoring initiative.

We have partnered with several schools to administer the CSWI survey to all students in Grades 6-12 who have obtained consent from their parents and given assent. The survey is administered **online using Qualtrics and has been optimized to efficiently collect CSWI data** and generate real-time reports for the entire district and each school.

## **Contact Information**

Michael Furlong. Ph.D., is a Research Professor and Distinguished Professor Emeritus of School Psychology at the University of California, Santa Barbara. He has received the 2022 School Mental Health Research Award from the National School Mental Health Center and the 2021-22 UCSB Edward A. Dickson Emeritus Professorship for his contributions. Dr. Furlong's expertise includes providing consultation and support to the California Department of Education and WestEd on matters related to the California Healthy Kids Survey. He is co-editor of the Handbook of Positive Psychology in Schools (2009, 2014, 2022). mfurlong@ucsb.edu

Erin Dowdy, Ph.D., is a Professor in the Department of Counseling, Clinical, and School Psychology at the University of California Santa Barbara. She is a licensed psychologist and a nationally certified school psychologist. Her research career and scholarly publications have focused on the universal assessment of social and emotional health and risk. She is committed to promoting equitable screening practices. Dr. Dowdy has a proven track record of disseminating research through peer-reviewed journals and at professional conferences. Her research and collaborative work with schools, state agencies, and community organizations have been funded by various agencies. edowdy@ucsb.edu

Hee Kyung Park, Ph.D., is a Postdoctoral Scholar in the Department of Counseling, Clinical, and School Psychology at the University of California, Santa Barbara. She holds a Pupil Personnel Services Credential in School Psychology. Her research interests include the development, implementation, and assessment of culturally responsive social-emotional learning interventions within multi-tiered systems of support, with a focus on both national and international contexts. <a href="mailto:parkheekyung@ucsb.edu">parkheekyung@ucsb.edu</a>
